

4. Write full use case specifications for three use cases

Use case 1: Update Class Status (delay/cancel)

Primary actor: teaching staff

The teaching staff is the primary actor, with students, Bus In-charge, and Admin as stakeholders. The preconditions are that the staff is logged in and the class is scheduled. The staff selects a class and marks it as Delayed, Cancelled, or Room Change. The system saves the update, checks bus requirements, and notifies the student. The postcondition is an updated class status.

Use case 2: Manage Bus Timing

Primary actor: Bus In-charge

The bus in-charge is the primary actor, with students, teaching staff and Admin as stakeholders. The staff views the affected route, checks the class status, and decides whether to hold or adjust the bus. The system saves the new timing and notifies students. The postcondition is an updated bus schedule. Alternate flows include no change being required, no active alert, or a conflicting timing update.

Use case 3: Connect with Alumni

Primary actor: Student

The student is the primary actor, with alumni, placement cell and admin as stakeholders. The student searches the alumni directory, selects an alumni profile, and sends a connection request. After acceptance, the system creates the connection and enables communication. The postcondition is an active mentorship connection. Alternate flows include the alumni declining, no matching alumni being found, or the request expiring.
